

## **Readme Replication**

Savaphol Hiruntiaranakul

December 2025

This repository contains files replicating the results extended from Hazell et al. (2022).

1. `create_data.do` generates data needed for regression using `data_reg.dta` which was provided by the authors. The new data is saved as `data_for_regression.dta`.
2. `replicate_and_extend_Table1.do` is the main file containing the code that loads the above data to replicate and extend the result in Table 1 in Hazell et al. (2022).
3. Note that the above code performs the two-sample two-stage least squares as in Chodorow-Reich and Wieland (2019) and requires the user to copy and paste the `.ado` and the helper files in their Stata personal directory.
4. The regression results were saved in the result folder.
